

Repository change report - past 10 day(s)

Generated by ciabatta ai

== Summary ==

Three big new subsystems landed, plus a distribution overhaul.
~14k lines added across 62 files, mostly new code, not churn.

MAJOR FEATURES

1. AI assistant (ciabatta ai) - largest addition, ~5k lines
(src/ai/{mod,brain,tools,provider,server,session,tui}.rs).
A learning agent with three front ends: a Ratatui chat TUI, a browser mind-map daemon, and one-shot 'ai ask'. Tags files, builds a file->architecture map, keeps a feedback-trained confidence score. State in .ciabatta/ai/brain.json.
Has plan/edit/auto modes and can run in a sandbox.
2. Deploy paradigm (ciabatta deploy) - ~2.4k lines
(src/deploy/{mod,engine,server}.rs + builder/index.html).
Runs a DAG of dependent script steps with on_error branches to recovery nodes offering fix scripts. Live web GUI (--gui) and a visual flowchart builder (--build). .env sourcing and env-var enforcement at deploy time.
3. Watch (ciabatta watch <cmd>) - ~1.4k lines
(src/watch/{mod,server}.rs + index.html). Runs a command via the shell, captures stdout/stderr into a bounded ring buffer, serves a searchable live log UI with bookmarks and trigger notifications. Bookmarks/triggers persist; log lines do not.

DISTRIBUTION / DOCS

- * One-line install: new frontend/public/install.{sh,ps1} served from the docs site; reworked install/ scripts with sudo fallback.
- * Docs site rebuilt: README (+210), new frontend/src/docs/* pages, screenshots, AI.md. Release workflow tweak; version bumps.

FIXES / REFACTORS

- * Registry layer touched broadly (src/registry/*); mostly small, but mod.rs (+184) merits a skim.
- * config.rs (+245) and main.rs (+475) grew to wire in the new deploy/ai/watch commands.

UNCOMMITTED WORK (not yet landed)

~1.2k lines across the AI subsystem plus a new git reporting API:

- * changes_since() and branch_commits() added to src/git.rs - powers 'ciabatta ai report' and the TUI /report command.
- * Active churn in ai/{mod,tui,tools,session}.rs and CLI wiring.

WORTH A CLOSER LOOK / RISK

- * AI tools.rs + sandbox execution (908 lines): the assistant can run shell commands and edit files. Review the sandbox boundary and auto-mode (applies changes without approval).
- * Deploy engine (629 lines) executes a script DAG with recovery branches - validate cycle/error handling; a bad flowchart could loop or run fix scripts unexpectedly.
- * .env sourcing precedence - confirm secrets are not logged in the GUI/watch views.
- * The AI report feature itself is still uncommitted.

NIT

.ciabatta/ai/suggestions/src/todo/mod.rs.orig was committed - a stray merge/backup artifact that likely should not be in the repo.
